

Configuration

Adjusting Processing Speed

You can increase the processing speed by changing the number of workers. The relevant line of code is located at **line 81** of `server.js`:

javascript

Copy code

```
const maxWorkers = 4;  
//Adjust this number to change the number of concurrent workers
```

Model Settings

The Whisper model used is set to **base** for transcription. You can change this to a different model (e.g., `small`, `medium`, `large`) in `transcriber.py` if you want more accurate results, but keep in mind that using larger models may increase processing time.

Performance Tips

- Adjusting the `maxWorkers` setting allows for parallel processing of multiple files. Increasing this value can lead to faster transcription but may require more system resources.
- Experiment with different Whisper models to find a balance between accuracy and processing speed.
